Chapter 1

Introduction

We define numerical methods that are based on discretizations preserving the properties of their continuum counterparts to be **mimetic**.

The **Mimetic Methods Toolkit (MTK)** is a C++ library for mimetic numerical methods. It is arranged as a set of classes for **mimetic quadratures**, mimetic interpolation$**$, and **mimetic finite differences** methods for the numerical solution of ordinary and partial differential equations.

An older version of this library is available outside of GitHub... just email me about it, and you can have it... it is ugly, yet functional and more complete.

1.1 MTK Concerns

Since collaborative development efforts are definitely important in achieving the level of generality we intend the library to possess, we have divided the library's source code according to the designated purpose the classes possess within the library. These divisions (or concerns) are grouped by layers, and are hierarchically related by the dependence they have among them.

One concern is said to depend on another one, if the classes the first concern includes, rely on the classes the second concern includes.

In order of dependence these are:

1. Roots.
2. Enumerations.
3. Tools.
4. Data Structures.
5. Numerical Methods.
6. Grids.
7. Mimetic Operators.

1.2 MTK Flavors

The MTK collection of wrappers is:

1. MMTK: MATLAB wrappers collection for MTK; intended for sequential computations.

Others are being designed and developed.

1.3 Contact, Support and Credits

The MTK is developed by researchers and adjuncts to the Computational Science Research Center (CSRC) at San Diego State University (SDSU).

Developers are members of:

1. Mimetic Numerical Methods Research and Development Group.
2. Computational Geoscience Research and Development Group.
3. Ocean Modeling Research and Development Group.

Currently the developers are:

1. **Eduardo J. Sanchez, Ph.D. - esanchez at mail dot sdsu dot edu** - ejspeiro
2. Jose E. Castillo, Ph.D. - jcastillo at mail dot sdsu dot edu
3. Guillermo F. Miranda, Ph.D. - unigrav at hotmail dot com

README File for the Mimetic Methods Toolkit (MTK)

By: **Eduardo J. Sanchez, Ph.D. – esanchez at mail dot sdsu dot edu**

1. Description

We define numerical methods that are based on discretizations preserving the properties of their continuum counterparts to be **mimetic**.

The **Mimetic Methods Toolkit (MTK)** is a C++ library for mimetic numerical methods. It is arranged as a set of classes for **mimetic quadratures**, **mimetic interpolation**, and **mimetic finite differences** methods for the numerical solution of ordinary and partial differential equations.

An older version of this library is available outside of GitHub... just email me about it, and you can have it... it is ugly, yet functional and more complete.

2. Dependencies

This README assumes all of these dependencies are installed in the following folder:

```
$(HOME)/Libraries/
```

In this version, the MTK optionally uses ATLAS-optimized BLAS and LAPACK routines for the internal computation on some of the layers. However, ATLAS requires both BLAS and LAPACK in order to create their optimized distributions. Therefore, the following dependencies tree arises:

For Linux:

1. LAPACK - Available from: http://www.netlib.org/lapack/
   1. BLAS - Available from: http://www.netlib.org/blas/

2. GLPK - Available from: https://www.gnu.org/software/glpk/

3. (Optional) ATLAS - Available from: http://math-atlas.sourceforge.net/
   1. LAPACK - Available from: http://www.netlib.org/lapack/
      1. BLAS - Available from: http://www.netlib.org/blas

4. (Optional) Valgrind - Available from: http://valgrind.org/

5. (Optional) Doxygen - Available from http://www.stack.nl/~dimitri/doxygen/

For OS X:

1. GLPK - Available from: https://www.gnu.org/software/glpk/

3. Installation

PART 1. CONFIGURATION OF THE MAKEFILE.

The following steps are required the build and test the MTK. Please use the accompanying Makefile.inc file, which should provide a solid template to start with. The following command provides help on the options for make:

```
$ make help
-----
Makefile for the MTK.

Options are:
- all: builds the library, the tests, and examples.
- mtklib: builds the library.
- test: builds the test files.
- example: builds the examples.

- testall: runs all the tests.

- gendoc: generates the documentation for the library.

- clean: cleans all the generated files.
- cleanlib: cleans the generated archive and object files.
- cleantest: cleans the generated tests executables.
- cleanexample: cleans the generated examples executables.
-----
```

PART 2. BUILD THE LIBRARY.

```
$ make
```

If successful you'll read (before building the examples):

```
----- Library created! Check in /home/ejspeiro/Dropbox/MTK/lib
```

Examples and tests will also be built.

4. Frequently Asked Questions

Q: Why haven't you guys implemented GBS to build the library?
A: I'm on it as we speak! ;)

Q: Is there any main reference when it comes to the theory on Mimetic Methods?
A: Yes! Check: http://www.csrc.sdsu.edu/mimetic-book

Q: Do I need to generate the documentation myself?
A: You can if you want to... but if you DO NOT want to, just go to our website.

Tests and Test Architectures

Tests are given in the `files list` section. They are provided in the /tests/ folder within the distributed software.

In this page we intend to make a summary of all of the architectures in where the MTK has been tested. The MTK is intended to be as portable as possible throughout architectures. The following architectures have provided flawless installations of the API and correct execution of the examples:

1. Linux 3.2.0-23-generic-pae #36-Ubuntu SMP i386 GNU/Linux.
   Intel(R) Pentium(R) M CPU 1.73 GHz 2048 KB of cache and stepping of 8.
   gcc version 4.6.3 (Ubuntu/Linaro 4.6.3-1ubuntu5).

2. Linux 3.13.0-67-generic #110-Ubuntu SMP x86_64 GNU/Linux.
   Intel(R) Core(TM) i7-4700MQ CPU 2.40 GHz 6144 KB of cache and stepping of 3.
   gcc version 4.8.4 (Ubuntu 4.4.4-2ubuntu1~14.04).

3. Linux 3.16.7-29-desktop #1 SMP PREEMPT (6be6a97) x86_64 GNU/Linux
   Intel(R) Core(TM) i7-4600U CPU 2.10 GHz 4096 KB of cache and a stepping of 1.
   gcc (SUSE Linux) 4.8.3 20140627 [gcc-4_8-branch revision 212064].

Further architectures will be tested!

Chapter 6

Examples

Examples are given in the `files list` section. They are provided in the /examples/ folder within the distributed software.

Todo List

Member mtk::DenseMatrix::Kron (const DenseMatrix &aa, const DenseMatrix &bb)

Implement Kronecker product using the BLAS.

Member mtk::DenseMatrix::OrderColMajor ()

Improve this so that no new arrays have to be created.

Member mtk::DenseMatrix::OrderRowMajor ()

Improve this so that no new arrays have to be created.

Member mtk::DenseMatrix::Transpose ()

Improve this so that no extra arrays have to be created.

Class mtk::GLPKAdapter

Rescind from the GLPK as the numerical core for CLO problems.

Member mtk::Matrix::IncreaseNumNull () noexcept

Review the definition of sparse matrices properties.

Member mtk::Matrix::IncreaseNumZero () noexcept

Review the definition of sparse matrices properties.

Member mtk::RobinBCDescriptor2D::ImposeOnGrid (UniStgGrid2D &grid, const Real &time=kZero) const

Implement imposition for vector-valued grids. Need research here!

Member mtk::RobinBCDescriptor2D::ImposeOnSouthBoundaryNoSpace (const Lap2D &lap, const UniStg↩ Grid2D &grid, DenseMatrix &matrix, const Real &time=kZero) const

Impose the Neumann conditions on every pole, for every scenario.

Member mtk::RobinBCDescriptor2D::ImposeOnSouthBoundaryWithSpace (const Lap2D &lap, const UniStg↩ Grid2D &grid, DenseMatrix &matrix, const Real &time=kZero) const

Impose Harmonic mean on the corners for the case when the generated space is available, for all poles.

Member mtk::Tools::Prevent (const bool complement, const char ∗const fname, int lineno, const char ∗const fxname) noexcept

Check if this is the best way of stalling execution.

Member mtk::Tools::test_number_

Check usage of static methods and private members.

Member mtk::UniStgGrid1D::discrete_domain_x () const

Review const-correctness of the pointer we return.

Member mtk::UniStgGrid1D::discrete_field ()

Review const-correctness of the pointer we return. Look at the STL!

Member mtk::UniStgGrid2D::discrete_domain_x () const

Review const-correctness of the pointer we return.

Member mtk::UniStgGrid2D::discrete_domain_y () const

Review const-correctness of the pointer we return.

File mtk_div_1d.cc

Overload ostream operator as in mtk::Lap1D.

Implement creation of ■ w. mtk::BLASAdapter.

File mtk_glpk_adapter_test.cc

Test the mtk::GLPKAdapter class.

File mtk_grad_1d.cc

Overload ostream operator as in mtk::Lap1D.

Implement creation of ■ w. mtk::BLASAdapter.

File mtk_lapack_adapter.cc

Write documentation using LaTeX.

File mtk_lapack_adapter_test.cc

Test the mtk::LAPACKAdapter class.

File mtk_quad_1d.h

Implement this class.

File mtk_roots.h

Documentation should (better?) capture effects from selective compilation.

Test selective precision mechanisms.

File mtk_uni_stg_grid_1d.h

Create overloaded binding routines that read data from files.

File mtk_uni_stg_grid_2d.h

Create overloaded binding routines that read data from files.

Chapter 9

Bug List

Member mtk::Matrix::set_num_null (const int &in) noexcept

-nan assigned on construction time due to num_values_ being 0.

Member mtk::Matrix::set_num_zero (const int &in) noexcept

-nan assigned on construction time due to num_values_ being 0.

14.1 Roots.

Fundamental execution parameters and defined types.

Typedefs

- typedef float mtk::Real

  Users can simply change this to build a double- or single-precision MTK.

Variables

- const float mtk::kZero {0.0f}

  MTK's zero defined according to selective compilation.
- const float mtk::kOne {1.0f}

  MTK's one defined according to selective compilation.
- const float mtk::kTwo {2.0f}

  MTK's two defined according to selective compilation.
- const float mtk::kDefaultTolerance {1e-7f}

  Considered tolerance for comparisons in numerical methods.
- const int mtk::kDefaultOrderAccuracy {2}

  Default order of accuracy for mimetic operators.
- const float mtk::kDefaultMimeticThreshold {1e-6f}

  Default tolerance for higher-order mimetic operators.
- const int mtk::kCriticalOrderAccuracyDiv {8}

  At this order (and higher) we must use the CBSA to construct.
- const int mtk::kCriticalOrderAccuracyGrad {10}

  At this order (and higher) we must use the CBSA to construct.

14.2 Enumerations.

Enumerations.

Enumerations

- enum mtk::MatrixStorage { mtk::DENSE, mtk::BANDED, mtk::CRS }

  Considered matrix storage schemes to implement sparse matrices.
- enum mtk::MatrixOrdering { mtk::ROW_MAJOR, mtk::COL_MAJOR }

  Considered matrix ordering (for Fortran purposes).
- enum mtk::FieldNature { mtk::SCALAR, mtk::VECTOR }

  Nature of the field discretized in a given grid.
- enum mtk::DirInterp { mtk::SCALAR_TO_VECTOR, mtk::VECTOR_TO_SCALAR }

  Interpolation operator.

14.2.1 Detailed Description

Enumerations.

14.2.2 Enumeration Type Documentation

14.2.2.1 enum mtk::DirInterp

Used to tag different directions of interpolation supported.

Enumerator

SCALAR_TO_VECTOR Interpolations places scalar on vectors' location.

VECTOR_TO_SCALAR Interpolations places vectors on scalars' location.

Definition at line 127 of file mtk_enums.h.

14.2.2.2 enum mtk::FieldNature

Fields can be **scalar** or **vector** in nature.

14.2.2.4 enum mtk::MatrixStorage

The considered sparse storage schemes are selected so that these are compatible with some of the most used mathematical APIs, as follows: DENSE and BANDED for BLAS, LAPACK, and ScaLAPACK. Finally, CRS for SuperLU.

Enumerator

DENSE Dense matrices, implemented as a 1D array: DenseMatrix.

BANDED Banded matrices ala LAPACK and ScaLAPACK: Must be implemented.

CRS Compressed-Rows Storage: Must be implemented.

Mimetic operators.

Classes

- class mtk::Div1D

  Implements a 1D mimetic divergence operator.
- class mtk::Div2D

  Implements a 2D mimetic divergence operator.
- class mtk::Grad1D

  Implements a 1D mimetic gradient operator.
- class mtk::Grad2D

  Implements a 2D mimetic gradient operator.
- class mtk::Interp1D

  Implements a 1D interpolation operator.
- class mtk::Interp2D

  Implements a 2D interpolation operator.
- class mtk::Lap1D

  Implements a 1D mimetic Laplacian operator.
- class mtk::Lap2D

  Implements a 2D mimetic Laplacian operator.
- class mtk::Quad1D

  Implements a 1D mimetic quadrature.
- class mtk::RobinBCDescriptor1D

  Impose Robin boundary conditions on the operators and on the grids.
- class mtk::RobinBCDescriptor2D

  Impose Robin boundary conditions on the operators and on the grids.

Typedefs

- typedef Real(∗ mtk::CoefficientFunction0D)(const Real &tt)

  A function of a BC coefficient evaluated on a 0D domain and time.
- typedef Real(∗ mtk::CoefficientFunction1D)(const Real &xx, const Real &tt)

  A function of a BC coefficient evaluated on a 1D domain and time.

SGELS solves overdetermined or underdetermined real linear systems involving an M-by-N matrix A, or its transpose, using a QR or LQ factorization of A. It is assumed that A has full rank.

The following options are provided:

1. If TRANS = 'N' and m >= n: find the least squares solution of an overdetermined system, i.e., solve the least squares problem

```
minimize || B - A*X ||.
```

2. If TRANS = 'N' and m < n: find the minimum norm solution of an underdetermined system A * X = B.
3. If TRANS = 'T' and m >= n: find the minimum norm solution of an undetermined system A**T * X = B.
4. If TRANS = 'T' and m < n: find the least squares solution of an overdetermined system, i.e., solve the least squares problem

```
minimize || B - A**T * X ||.
```

Several right hand side vectors b and solution vectors x can be handled in a single call; they are stored as the columns of the M-by-NRHS right hand side matrix B and the N-by-NRHS solution matrix X.

  Real-Arithmetic General (Dense matrices) Matrix-Vector Multiplier.

- static DenseMatrix RealDenseMM (DenseMatrix &aa, DenseMatrix &bb)

  Real-Arithmetic General (Dense matrices) Matrix-Matrix multiplier.

- static DenseMatrix RealDenseSM (Real alpha, DenseMatrix &aa)

  Real-Arithmetic General (Dense matrices) Scalar-Matrix multiplier.

16.1.1 Detailed Description

This class contains a collection of static classes, that posses direct access to the underlying structure of the matrices, thus allowing programmers to exploit some of the numerical methods implemented in the BLAS.

The **BLAS (Basic Linear Algebra Subprograms)** are routines that provide standard building blocks for performing basic vector and matrix operations. The Level 1 BLAS perform scalar, vector and vector-vector operations, the Level 2 BLAS perform matrix-vector operations, and the Level 3 BLAS perform matrix-matrix operations.

- bool WriteToFile (const std::string &filename) const

  Writes matrix to a file compatible with Gnuplot 4.6.

Static Public Member Functions

- static DenseMatrix Kron (const DenseMatrix &aa, const DenseMatrix &bb)

  Construct a dense matrix based on the Kronecker product of arguments.

Private Attributes

- Matrix matrix_properties_

  Data related to the matrix nature.

- Real * data_

  Array holding the data in contiguous position in memory.

Friends

- std::ostream & operator<< (std::ostream &stream, DenseMatrix &in)

  Prints the matrix as a block of numbers (standard way).

16.2.1 Detailed Description

For developing purposes, it is better to have a not-so-intrincated data structure implementing matrices. This is the purpose of this class: to be used for prototypes of new code for small test cases. In every other instance, this should be replaced by the most appropriate sparse matrix.

Here is the call graph for this function:

16.2.2.4 mtk::DenseMatrix::DenseMatrix (const int & *rank,* const bool & *padded,* const bool & *transpose*)

Used in the construction of the mimetic operators.

Def$**$. A **padded matrix** is a matrix with its first and last rows initialized to only zero values:

$$\bar{\mathbf{I}} = \begin{pmatrix} 0 & 0 & 0 & \dots & 0 \\ 1 & 0 & 0 & \dots & 0 \\ 0 & 1 & 0 & \dots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \dots & 1 \\ 0 & 0 & 0 & \dots & 0 \end{pmatrix}$$

Parameters

in	*rank*	Rank or number of rows/cols in square matrix.
in	*padded*	Should it be padded?
in	*transpose*	Should I return the transpose of the requested matrix?

Exceptions

std::bad_alloc	

Definition at line 223 of file mtk_dense_matrix.cc.

Here is the call graph for this function:

16.2.2.5 mtk::DenseMatrix::DenseMatrix (const Real $*$const *gen,* const int & *gen_length,* const int & *pro_length,* const bool & *transpose*)

Def$**$. In linear algebra, a **Vandermonde matrix** is a matrix with terms of a geometric progression in each row. This progression uses the terms of a given **generator vector**:

$$\mathbf{V} = \begin{pmatrix} 1 & \alpha_1 & \alpha_1^2 & \dots & \alpha_1^{n-1} \\ 1 & \alpha_2 & \alpha_2^2 & \dots & \alpha_2^{n-1} \\ 1 & \alpha_3 & \alpha_3^2 & \dots & \alpha_3^{n-1} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 1 & \alpha_m & \alpha_m^2 & \dots & \alpha_m^{n-1} \end{pmatrix}$$

This constructor generates a Vandermonde matrix, as defined above.

Obs$**$. It in important to understand that the generator vectors to be used are nothing but a very particular instance of a grid. These are little chunks, little samples, if you will, of a grid which is rectangular and uniform. So the selected samples, on the mtk::Div1D and mtk::Grad1D, basically represent the entire space, the entire grid. This is why nor the CRS nor the CBS algorithms may work for irregular geometries, such as curvilinear grids.

Parameters

in	*gen*	Given generator vector.
in	*gen_length*	Length generator vector.
in	*pro_length*	Length the progression.
in	*transpose*	Should the transpose be created instead?

16.3.3.1 bool mtk::Div1D::AssembleOperator (void) [private]

Construct the output array with the operator and its weights.

1. The first entry of the array will contain the order of accuracy.
2. The second entry the collection of coefficients for interior of grid.
3. If order_accuracy_ $>$ 2, then third entry is the collection of weights.
4. If order_accuracy_ $>$ 2, next dim_null_ entries is approximating coefficients for the west boundary of the grid.

Returns

Coefficients for the interior of the grid.

Definition at line 320 of file mtk_div_1d.cc.

16.3.3.3 bool mtk::Div1D::ComputePreliminaryApproximations (void) [private]

Compute the set of preliminary approximations on the boundary neighborhood.

1. Create generator vector for the first approximation.
2. Compute the dim_null near-the-boundary columns of the pi matrix.
3. Create the Vandermonde matrix for this iteration.
4. New order-selector vector (gets re-written with LAPACK solutions).
5. Solving TT*rr = ob yields the columns rr of the KK matrix.
6. Scale the KK matrix to make it a rational basis for null-space.
7. Extract the last dim_null values of the pre-scaled ob.
8. Once we posses the bottom elements, we proceed with the scaling.

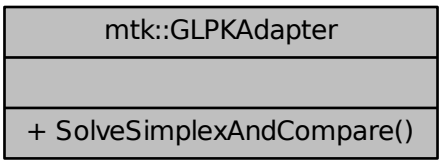
16.5 mtk::GLPKAdapter Class Reference

Adapter class for the GLPK API.

`#include <mtk_glpk_adapter.h>`

Collaboration diagram for mtk::GLPKAdapter:



Static Public Member Functions

- static mtk::Real SolveSimplexAndCompare (mtk::Real *A, int nrows, int ncols, int kk, mtk::Real *hh, mtk::Real *qq, int robjective, mtk::Real mimetic_tol, int copy)

  Solves a CLO problem and compares the solution to a reference solution.

16.5.1 Detailed Description

This class contains a collection of static classes, that posses direct access to the underlying structure of the matrices, thus allowing programmers to exploit some of the numerical methods implemented in the GLPK.

The **GLPK (GNU Linear Programming Kit)** package is intended for solving large-scale linear programming (LP), mixed integer programming (MIP), and other related problems. It is a set of routines written in ANSI C and organized in the form of a callable library.

Warning

We use the GLPK temporarily in order to test the CBSA, but it will be removed due to potential licensing issues.

This routine is the pivot of the CBSA. It solves a Constrained Linear Optimization (CLO) problem, and it compares the attained solution to a given reference solution. This comparison is done computing the norm-2 relative error.

Parameters

in	*alpha*	First scalar.
in	*AA*	Given matrix.
in	*xx*	First vector.
in	*beta*	Second scalar.
in	*beta*	Second scalar.
in,out	*yy*	Second vector (output).
in	*xx*	First vector.
in	*beta*	Second scalar.
in	*beta*	Second scalar.

Returns

Relative error computed between attained solution and provided ref.

Warning

GLPK indexes in [1,n], so we must get the extra space needed.

1. Memory allocation.
2. Fill the problem.
3. Copy the row to the vector objective.
4. Forming the RHS.
5. Setting up the objective function.

16.10.3.1 bool mtk::Lap1D::ConstructLap1D (int *order_accuracy* = kDefaultOrderAccuracy, mtk::Real *mimetic_threshold* = kDefaultMimeticThreshold)

Returns

Success of the solution.

1. Create gradient operator using specific values for the Laplacian.
2. Create gradient operator using specific values for the Laplacian.
3. Create both operators as matrices.
4. Multiply both operators: $\check{\mathbf{L}}_x^k = \check{\mathbf{D}}_x^k \check{\mathbf{G}}_x^k$
5. Extract the coefficients from the matrix and store them in the array.

Warning

We do not compute weights for this operator... no need to!

1. The first entry of the array will contain the order of accuracy.
2. The second entry of the array will contain the collection of approximating coefficients for the interior of the grid.

1. Extract mimetic coefficients from the west boundary.
2. Extract interior coefficients.
3. Extract mimetic coefficients from the west boundary to go east.

Note

We could create two matrices of the requested size and multiply them, but that would be inefficient, since we already have the computed coefficients stored. We just have to set them in place, in a matrix of an adequate size, and multiply them times the inverse of the square of the step size, in order for the matrix to actually represent a differential operator.

16.15.1 Detailed Description

This class presents an interface for the user to specify Robin boundary conditions on 1D mimetic operators and the grids they are acting on.

Def. Let $u(\mathbf{x},t) : \Omega \times [t_0,t_n] \mapsto \mathbb{R}$ be the solution to an ordinary or partial differential equation of interest. We say that u satisfies a **Robin boundary condition on** $\partial\Omega$ if and only if there exists $\beta(\mathbf{x},t) : \Omega \times [t_0,t_n] \mapsto \mathbb{R}$ so that:

$$\forall t \in [t_0,t_n] \; \forall \mathbf{x} \in \partial\Omega : \delta(\mathbf{x},t)u(\mathbf{x},t) + \eta(\mathbf{x},t)(\hat{\mathbf{n}} \cdot \nabla u) = \beta(\mathbf{x},t).$$

Intuitively, a **Robin boundary condition** is a constraint that must be satisfied by any linear combination of any scalar field u and its first normal derivative, in order for u to represent a unique solution to a given ordinary or partial differential equation of interest.

In a 1D context ($\partial\Omega = \{a,b\} \subset \mathbb{R}$), this condition can be written as follows:

$$\delta_a(a,t)u(a,t) - \eta_a(a,t)u'(a,t) = \beta_a(a,t),$$
$$\delta_b(b,t)u(b,t) + \eta_b(b,t)u'(b,t) = \beta_b(b,t).$$

Instances of this class receive information about the coefficient functions and each condition for any subset of the boundary (west and east, in 1D). These instances then handle the complexity of placing the coefficients in the differentiation matrices and the conditions in the grids.

Parameters

in	*lap*	Operator in the Matrix.
in,out	*matrix*	Input Laplacian operator.
in	*time*	Current time snapshot. Default is kZero.

Returns

Success of the imposition.

1. Impose Dirichlet coefficients. 1.1. Impose Dirichlet condition at the west.

1.2. Impose Dirichlet condition at the east.

1. Impose Neumann coefficients.

2.1. Create a mimetic gradient to approximate the first derivative.

2.2. Extract the coefficients approximating the boundary.

Warning

Coefficients returned by the mim_bndy getter are dimensionless! Therefore we must scale them by delta_x (from the grid), before adding to the matrix! But this information is in the given lap!

2.3. Impose Neumann condition at the west.

2.3.1. Get gradient coefficient and scale it.

2.3.2. Multiply times the coefficient for this boundary, times the unit normal for this boundary.

2.3.3. Set the final value summing it with what is on the matrix.

2.4. Impose Neumann condition at the east.

Warning

The Coefficients returned by the mim_bndy getter are those intended for the west boundary. We must enforce the center-skew-symmetry of the resulting operator by permuting their location in the matrix, and changing their sign.

2.4.1. Get gradient coefficient and scale it.

2.4.2. Multiply times the coefficient for this boundary, times the unit normal for this boundary, and change the sign to enforce center-skew-symmetry.

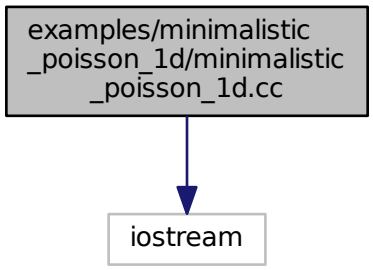
Poisson Equation on a 1D Uniform Staggered Grid with Robin BCs.

```
#include <iostream>
```

Include dependency graph for minimalistic_poisson_1d.cc:



Functions

- int main ()

17.1.1 Detailed Description

We solve:

$$-\nabla^2 p(x) = s(x),$$

for $x \in \Omega = [a,b] = [0,1]$.

The source term function is defined as:

$$s(x) = -\frac{\lambda^2 \exp(\lambda x)}{\exp(\lambda) - 1},$$

where $\lambda = -1$ is a real-valued parameter.

We consider Robin's boundary conditions of the form:

$$\alpha p(a) - \beta p'(a) = \omega,$$

$$\alpha p(b) + \beta p'(b) = \varepsilon,$$

where $\alpha = -\exp(\lambda)$, $\beta = (\exp(\lambda) - 1.0)/\lambda$, $\omega = -1$, and $\varepsilon = 0$.

The analytical solution for this problem is given by:

$$p(x) = \frac{\exp(\lambda x) - 1}{\exp(\lambda) - 1}.$$

The mimetic counterpart of this equation is:

$$-\check{\mathbf{L}}_x^k \tilde{p} = \tilde{s}.$$

Finally, we will solve this problem considering $k = 2$.

Poisson Equation on a 2D Uniform Staggered Grid with Robin BCs.

Functions

- int main ()

17.5.1 Detailed Description

We solve:

$$\nabla^2 p(x) = -s(x),$$

for $x \in \Omega = [a,b] = [0,1]$.

The source term function is defined as

$$s(x) = \frac{\lambda^2 \exp(\lambda x)}{\exp(\lambda) - 1}$$

where $\lambda = -1$ is a parameter.

We consider Robin's boundary conditions of the form:

$$\alpha p(a) - \beta p'(a) = \omega,$$

$$\alpha p(b) + \beta p'(b) = \varepsilon.$$

The analytical solution for this problem is given by

$$p(x) = \frac{\exp(\lambda x) - 1}{\exp(\lambda) - 1}.$$

Classes

- class mtk::BLASAdapter

  Adapter class for the BLAS API.

Namespaces

- mtk

  Mimetic Methods Toolkit namespace.

17.9.1 Detailed Description

This class contains a collection of static classes, that posses direct access to the underlying structure of the matrices, thus allowing programmers to exploit some of the numerical methods implemented in the BLAS.

The **BLAS (Basic Linear Algebra Subprograms)** are routines that provide standard building blocks for performing basic vector and matrix operations. The Level 1 BLAS perform scalar, vector and vector-vector operations, the Level 2 BLAS perform matrix-vector operations, and the Level 3 BLAS perform matrix-matrix operations.

The BLAS can be installed from links given in the See Also section of this page.

  Defines a common dense matrix, using a 1D array.

Namespaces

  Mimetic Methods Toolkit namespace.

17.11.1 Detailed Description

For developing purposes, it is better to have a not-so-intrincated data structure implementing matrices. This is the purpose of this class: to be used for prototypes of new code for small test cases. In every other instance, this should be replaced by the most appropriate sparse matrix.

Note

We prefer composition to inheritance [Reedy, 2011]. The main reason for this preference is that inheritance produces a more tightly coupled design. When a class inherits from another type be it public, protected, or private inheritance the subclass gains access to all public and protected members of the base class, whereas with composition, the class is only coupled to the public members of the other class. Furthermore, if you only hold a pointer to the other object, then your interface can use a forward declaration of the class rather than #include its full definition. This results in greater compile-time insulation and improves the time it takes to compile your code.

Classes

- class mtk::GLPKAdapter

  Adapter class for the GLPK API.

Namespaces

- mtk

  Mimetic Methods Toolkit namespace.

17.19.1 Detailed Description

This class contains a collection of static classes, that posses direct access to the underlying structure of the matrices, thus allowing programmers to exploit some of the numerical methods implemented in the GLPK.

The **GLPK (GNU Linear Programming Kit)** package is intended for solving large-scale linear programming (LP), mixed integer programming (MIP), and other related problems. It is a set of routines written in ANSI C and organized in the form of a callable library.

Classes

- class mtk::LAPACKAdapter

  Adapter class for the LAPACK API.

Namespaces

- mtk

  Mimetic Methods Toolkit namespace.

17.33.1 Detailed Description

This class contains a collection of static classes, that posses direct access to the underlying structure of the matrices, thus allowing programmers to exploit some of the numerical methods implemented in the LAPACK.

The **LAPACK (Linear Algebra PACKage)** is written in Fortran 90 and provides routines for solving systems of simultaneous linear equations, least-squares solutions of linear systems of equations, eigenvalue problems, and singular value problems.

17.39.1 Detailed Description

This class presents an interface for the user to specify Robin boundary conditions on 1D mimetic operators and the grids they are acting on.

Def. Let $u(\mathbf{x},t) : \Omega \times [t_0,t_n] \mapsto \mathbb{R}$ be the solution to an ordinary or partial differential equation of interest. We say that u satisfies a **Robin boundary condition on** $\partial\Omega$ if and only if there exists $\beta(\mathbf{x},t) : \Omega \times [t_0,t_n] \mapsto \mathbb{R}$ so that:

$$\forall t \in [t_0,t_n] \; \forall \mathbf{x} \in \partial\Omega : \delta(\mathbf{x},t)u(\mathbf{x},t) + \eta(\mathbf{x},t)(\hat{\mathbf{n}} \cdot \nabla u) = \beta(\mathbf{x},t).$$

Intuitively, a **Robin boundary condition** is a constraint that must be satisfied by any linear combination of any scalar field u and its first normal derivative, in order for u to represent a unique solution to a given ordinary or partial differential equation of interest.

In a 1D context ($\partial\Omega = \{a,b\} \subset \mathbb{R}$), this condition can be written as follows:

$$\delta_a(a,t)u(a,t) - \eta_a(a,t)u'(a,t) = \beta_a(a,t),$$

$$\delta_b(b,t)u(b,t) + \eta_b(b,t)u'(b,t) = \beta_b(b,t).$$

Instances of this class receive information about the coefficient functions and each condition for any subset of the boundary (west and east, in 1D). These instances then handle the complexity of placing the coefficients in the differentiation matrices and the condition in the grids.

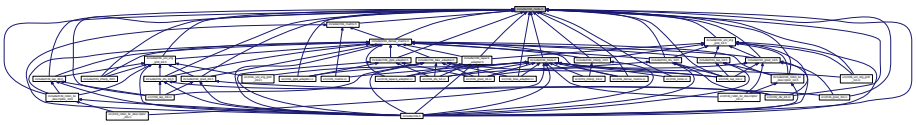
17.43 include/mtk_roots.h File Reference

Fundamental definitions to be used across all classes of the MTK.

This graph shows which files directly or indirectly include this file:



Namespaces

- mtk

  Mimetic Methods Toolkit namespace.

Typedefs

- typedef float mtk::Real

  Users can simply change this to build a double- or single-precision MTK.

Variables

- const float mtk::kZero {0.0f}

  MTK's zero defined according to selective compilation.
- const float mtk::kOne {1.0f}

  MTK's one defined according to selective compilation.
- const float mtk::kTwo {2.0f}

  MTK's two defined according to selective compilation.
- const float mtk::kDefaultTolerance {1e-7f}

  Considered tolerance for comparisons in numerical methods.
- const int mtk::kDefaultOrderAccuracy {2}

  Default order of accuracy for mimetic operators.
- const float mtk::kDefaultMimeticThreshold {1e-6f}

  Default tolerance for higher-order mimetic operators.

- const int mtk::kCriticalOrderAccuracyDiv {8}

  At this order (and higher) we must use the CBSA to construct.
- const int mtk::kCriticalOrderAccuracyGrad {10}

  At this order (and higher) we must use the CBSA to construct.

17.43.1 Detailed Description

This file contains the fundamental definitions that classes of the MTK rely on to be implemented. Examples of these definitions are the definition of fundamental data types, and global variables affecting the construction of mimetic operators, among others.

00001 # The Mimetic Methods Toolkit (MTK)
00002

00005
00006 ## 1. Description
00007
00008 We define numerical methods that are based on discretizations preserving the
00009 properties of their continuum counterparts to be **mimetic**.
00010
00011 The **Mimetic Methods Toolkit (MTK)** is a C++ library for mimetic numerical
00012 methods. It is arranged as a set of classes for **mimetic quadratures**,
00013 **mimetic interpolation**, and **mimetic finite differences** methods for the
00014 numerical solution of ordinary and partial differential equations.
00015
00016 An older version of this library is available outside of GitHub... just email me
00017 about it, and you can have it... it is ugly, yet it is functional and more
00018 complete.
00019     _____________________________________________________________________
00020
00021 ## 2. Dependencies
00022
00023 This README assumes all of these dependencies are installed in the following
00024 folder:
00025
00026 ```
00027 $(HOME)/Libraries/
00028 ```
00029
00030 In this version, the MTK optionally uses ATLAS-optimized BLAS and LAPACK
00031 routines for the internal computation on some of the layers. However, ATLAS
00032 requires both BLAS and LAPACK in order to create their optimized distributions.
00033 Therefore, the following dependencies tree arises:
00034
00035 ### For Linux:
00036
00037 1. LAPACK - Available from: http://www.netlib.org/lapack/
00038   1. BLAS - Available from: http://www.netlib.org/blas/
00039
00040 2. GLPK - Available from: https://www.gnu.org/software/glpk/
00041
00042 3. (Optional) ATLAS - Available from: http://math-atlas.sourceforge.net/
00043   1. LAPACK - Available from: http://www.netlib.org/lapack/
00044     1. BLAS - Available from: http://www.netlib.org/blas
00045
00046 4. (Optional) Valgrind - Available from: http://valgrind.org/
00047
00048 5. (Optional) Doxygen - Available from http://www.stack.nl/~dimitri/doxygen/
00049
00050 ### For OS X:
00051
00052 1. GLPK - Available from: https://www.gnu.org/software/glpk/
00053     _____________________________________________________________________
00054
00055 ## 3. Installation
00056
00057 ### PART 1. CONFIGURATION OF THE MAKEFILE.
00058
00059 The following steps are required to build and test the MTK. Please use the
00060 accompanying `Makefile.inc` file, which should provide a solid template to
00061 start with. The following command provides help on the options for make:
00062
00063 ```
00064 $ make help
00065 -----
00066 Makefile for the MTK.
00067
00068 Options are:
00069 - all: builds the library, the tests, and examples.
00070 - mtklib: builds the library.
00071 - test: builds the test files.
00072 - example: builds the examples.
00073
00074 - testall: runs all the tests.
00075
00076 - gendoc: generates the documentation for the library.
00077
00078 - clean: cleans all the generated files.
00079 - cleanlib: cleans the generated archive and object files.
00080 - cleantest: cleans the generated tests executables.
00081 - cleanexample: cleans the generated examples executables.
00082 -----
00083 ```
00084
00085 ### PART 2. BUILD THE LIBRARY.
```

```
00086
00087 ```
00088 $ make
00089 ```
00090
00091 If successful you'll read (before building the tests and examples):
00092
00093 ```
00094 ----- Library created! Check in /home/ejspeiro/Dropbox/MTK/lib
00095 ```
00096
00097 Examples and tests will also be built.
00098     ___________________________________________________________
00099
00100 ## 4. Frequently Asked Questions
00101
00102 Q: Why haven't you guys implemented GBS to build the library?
00103 A: I'm on it as we speak! ;)
00104
00105 Q: Is there any main reference when it comes to the theory on Mimetic Methods?
00106 A: Yes! Check: http://www.csrc.sdsu.edu/mimetic-book
00107
00108 Q: Do I need to generate the documentation myself?
00109 A: You can if you want to... but if you DO NOT want to, just go to our website.

17.55.1 Detailed Description

This class contains a collection of static classes, that posses direct access to the underlying structure of the matrices, thus allowing programmers to exploit some of the numerical methods implemented in the BLAS.

The **BLAS (Basic Linear Algebra Subprograms)** are routines that provide standard building blocks for performing basic vector and matrix operations. The Level 1 BLAS perform scalar, vector and vector-vector operations, the Level 2 BLAS perform matrix-vector operations, and the Level 3 BLAS perform matrix-matrix operations.

The BLAS can be installed from links given in the See Also section of this page.

17.59.1 Detailed Description

This class implements a 1D divergence matrix operator, constructed using the Castillo-Blomgren-Sanchez (CBS) Algorithm.

Author

: Eduardo J. Sanchez (ejspeiro) - esanchez at mail dot sdsu dot edu

Todo Overload ostream operator as in mtk::Lap1D.

Todo Implement creation of ■ w. mtk::BLASAdapter.

Definition in file mtk_div_1d.cc.

17.63.1 Detailed Description

This class contains a collection of static classes, that posses direct access to the underlying structure of the matrices, thus allowing programmers to exploit some of the numerical methods implemented in the GLPK.

The **GLPK (GNU Linear Programming Kit)** package is intended for solving large-scale linear programming (LP), mixed integer programming (MIP), and other related problems. It is a set of routines written in ANSI C and organized in the form of a callable library.

17.65.1 Detailed Description

This class implements a 1D gradient matrix operator, constructed using the Castillo-Blomgren-Sanchez (CBS) Algorithm.

Author

: Eduardo J. Sanchez (ejspeiro) - esanchez at mail dot sdsu dot edu

Todo Overload ostream operator as in mtk::Lap1D.

Todo Implement creation of ■ w. mtk::BLASAdapter.

17.75.1 Detailed Description

This class contains a collection of static classes, that posses direct access to the underlying structure of the matrices, thus allowing programmers to exploit some of the numerical methods implemented in the LAPACK.

The **LAPACK (Linear Algebra PACKage)** is written in Fortran 90 and provides routines for solving systems of simultaneous linear equations, least-squares solutions of linear systems of equations, eigenvalue problems, and singular value problems.

17.79.1 Detailed Description

This class presents an interface for the user to specify Robin boundary conditions on 1D mimetic operators and the grids they are acting on.

Def. Let $u(\mathbf{x},t) : \Omega \times [t_0,t_n] \mapsto \mathbb{R}$ be the solution to an ordinary or partial differential equation of interest. We say that u satisfies a **Robin boundary condition on** $\partial\Omega$ if and only if there exists $\beta(\mathbf{x},t) : \Omega \times [t_0,t_n] \mapsto \mathbb{R}$ so that:

$$\forall t \in [t_0,t_n] \; \forall \mathbf{x} \in \partial\Omega : \delta(\mathbf{x},t)u(\mathbf{x},t) + \eta(\mathbf{x},t)(\hat{\mathbf{n}} \cdot \nabla u) = \beta(\mathbf{x},t).$$

Intuitively, a **Robin boundary condition** is a constraint that must be satisfied by any linear combination of any scalar field u and its first normal derivative, in order for u to represent a unique solution to a given ordinary or partial differential equation of interest.

In a 1D context ($\partial\Omega = \{a,b\} \subset \mathbb{R}$), this condition can be written as follows:

$$\delta_a(a,t)u(a,t) - \eta_a(a,t)u'(a,t) = \beta_a(a,t),$$
$$\delta_b(b,t)u(b,t) + \eta_b(b,t)u'(b,t) = \beta_b(b,t).$$

Instances of this class receive information about the coefficient functions and each condition for any subset of the boundary (west and east, in 1D). These instances then handle the complexity of placing the coefficients in the differentiation matrices and the condition in the grids.
